

## 2.7V to 5.5V Single-Supply CMOS Op Amps

### Features

- Single-Supply: 2.7V to 5.5V
- Rail-to-Rail Output
- Input Range Includes Ground
- Gain Bandwidth Product: 2.8 MHz (typ.)
- Unity-Gain Stable
- Low Quiescent Current: 230  $\mu$ A/amplifier (typ.)
- Chip Select ( $\overline{CS}$ ): **MCP603 only**
- Temperature Ranges:
  - Industrial: -40°C to +85°C
  - Extended: -40°C to +125°C
- Available in Single, Dual and Quad

### Typical Applications

- Portable Equipment
- A/D Converter Driver
- Photo Diode Pre-amp
- Analog Filters
- Data Acquisition
- Notebooks and PDAs
- Sensor Interface

### Available Tools

- SPICE Macro Models at [www.microchip.com](http://www.microchip.com)
- FilterLab<sup>®</sup> Software at [www.microchip.com](http://www.microchip.com)

### Description

The Microchip Technology Inc. MCP601/2/3/4 family of low-power operational amplifiers (op amps) are offered in single (MCP601), single with Chip Select ( $\overline{CS}$ ) (MCP603), dual (MCP602) and quad (MCP604) configurations. These op amps utilize an advanced CMOS technology that provides low bias current, high-speed operation, high open-loop gain and rail-to-rail output swing. This product offering operates with a single supply voltage that can be as low as 2.7V, while drawing 230  $\mu$ A (typ.) of quiescent current per amplifier. In addition, the common mode input voltage range goes 0.3V below ground, making these amplifiers ideal for single-supply operation.

These devices are appropriate for low-power, battery-operated circuits due to the low quiescent current, for A/D convert driver amplifiers because of their wide bandwidth or for anti-aliasing filters by virtue of their low input bias current.

The MCP601, MCP602 and MCP603 are available in standard 8-lead PDIP, SOIC and TSSOP packages. The MCP601 and MCP601R are also available in a standard 5-lead SOT-23 package, while the MCP603 is available in a standard 6-lead SOT-23 package. The MCP604 is offered in standard 14-lead PDIP, SOIC and TSSOP packages.

The MCP601/2/3/4 family is available in the Industrial and Extended temperature ranges and has a power supply range of 2.7V to 5.5V.

### Package Types

# MCP601/2/3/4

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

$V_{DD} - V_{SS}$ .....	7.0V
All inputs and outputs .....	$V_{SS} - 0.3V$ to $V_{DD} + 0.3V$
Difference Input voltage .....	$ V_{DD} - V_{SS} $
Output Short Circuit Current .....	continuous
Current at Input Pin .....	$\pm 2$ mA
Current at Output and Supply Pins .....	$\pm 30$ mA
Storage temperature .....	$-65^{\circ}\text{C}$ to $+150^{\circ}\text{C}$
Junction temperature .....	$+150^{\circ}\text{C}$
ESD protection on all pins (HBM; MM) .....	$\geq 3$ kV; 200V

† **Notice:** Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operational listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### DC CHARACTERISTICS

<b>Electrical Specifications:</b> Unless otherwise specified, $T_A = +25^{\circ}\text{C}$ , $V_{DD} = +2.7V$ to $+5.5V$ , $V_{SS} = \text{GND}$ , $V_{CM} = V_{DD}/2$ , $V_{OUT} \approx V_{DD}/2$ and $R_L = 100$ k $\Omega$ to $V_{DD}/2$ .						
Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Input Offset</b>						
Input Offset Voltage	$V_{OS}$	-2	$\pm 0.7$	+2	mV	
Industrial Temperature	$V_{OS}$	-3	$\pm 1$	+3	mV	$T_A = -40^{\circ}\text{C}$ to $+85^{\circ}\text{C}$ ( <b>Note 1</b> )

## TEMPERATURE CHARACTERISTICS

Electrical Specifications: Unless otherwise indicated, $V_{DD} = +2.7V$ to $+5.5V$ and $V_{SS} = GND$ .						
Parameters	Sym	Min	Typ	Max	Units	Conditions
<b>Temperature Ranges</b>						
Specified Temperature Range	$T_A$	-40	—	+85	°C	Industrial temperature parts
	$T_A$	-40	—	+125	°C	Extended temperature parts
Operating Temperature Range	$T_A$	-40	—	+125	°C	<b>Note</b>
Storage Temperature Range	$T_A$	-65	—	+150	°C	
<b>Thermal Package Resistances</b>						
Thermal Resistance, 5L-SOT23	$\theta_{JA}$	—	256	—	°C/W	
Thermal Resistance, 6L-SOT23	$\theta_{JA}$	—	230	—	°C/W	
Thermal Resistance, 8L-PDIP	$\theta_{JA}$	—	85	—	°C/W	
Thermal Resistance, 8L-SOIC	$\theta_{JA}$	—	163	—	°C/W	
Thermal Resistance, 8L-TSSOP	$\theta_{JA}$	—	124	—	°C/W	
Thermal Resistance, 14L-PDIP	$\theta_{JA}$	—	70	—	°C/W	
Thermal Resistance, 14L-SOIC	$\theta_{JA}$	—	120	—	°C/W	
Thermal Resistance, 14L-TSSOP	$\theta_{JA}$	—	100	—	°C/W	

**Note:** The Industrial temperature parts operate over this extended range, but with reduced performance. The Extended temperature specs do not apply to Industrial temperature parts. In any case, the internal Junction temperature ( $T_J$ ) must not exceed the absolute maximum specification of 150°C.

## 2.0 TYPICAL PERFORMANCE CURVES

**Note:** The graphs and tables provided following this note are a statistical summary based on a limited number of samples and are provided for informational purposes only. The performance characteristics listed herein are not tested or guaranteed. In some graphs or tables, the data presented may be outside the specified operating range (e.g., outside specified power supply range) and therefore outside the warranted range.

**Note:** Unless otherwise indicated,  $T_A = +25^\circ\text{C}$ ,  $V_{DD} = +2.7\text{V}$  to  $+5.5\text{V}$ ,  $V_{SS} = \text{GND}$ ,  $V_{CM} = V_{DD}/2$ ,  $R_L = 100\text{ k}\Omega$  to  $V_{DD}/2$ ,  $V_{OUT} \approx V_{DD}/2$  and  $C_L = 50\text{ pF}$ .

## 3.0 APPLICATIONS INFORMATION

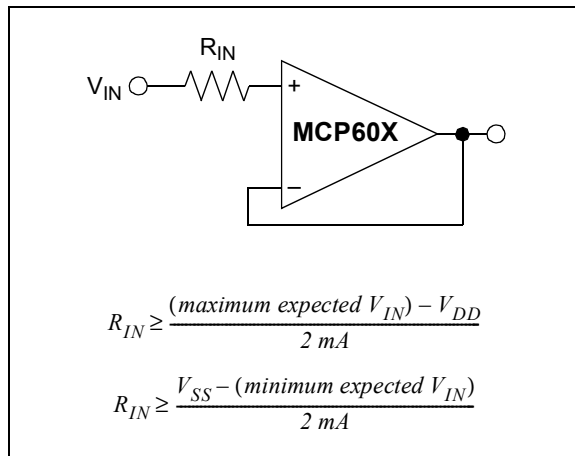

The MCP601/2/3/4 family of op amps are fabricated on Microchip's state-of-the-art CMOS process. They are unity-gain stable and suitable for a wide range of general purpose applications.

### 3.1 Input

The MCP601/2/3/4 amplifier family is designed to not exhibit phase reversal when the input pins exceed the supply rails. Figure 2-33 shows an input voltage that exceeds both supplies with no resulting phase inversion.

The Common Mode Input Voltage Range ( $V_{CMR}$ ) includes ground in single-supply systems ( $V_{SS}$ ), but does not include  $V_{DD}$ . This means that the amplifier input behaves linearly as long as the Common Mode Input Voltage ( $V_{CM}$ ) is kept within the specified  $V_{CMR}$  limits ( $V_{SS} - 0.3V$  to  $V_{DD} - 1.2V$  at  $+25^{\circ}C$ ).

Input voltages that exceed the input voltage range ( $V_{SS} - 0.3V$  to  $V_{DD} - 1.2V$  at  $+25^{\circ}C$ ) can cause excessive current to flow into or out of the input pins. Current beyond  $\pm 2$  mA may cause reliability problems. Applications that exceed this rating must externally limit the input current with a resistor ( $R_{IN}$ ), as shown in Figure 3-1.

**FIGURE 3-1:**  $R_{IN}$  limits the current flow into an input pin.

### 3.2 Rail-to-Rail Output

There are two specifications that describe the output swing capability of the MCP601/2/3/4 family of op amps. The first specification (Maximum Output Voltage Swing) defines the absolute maximum swing that can be achieved under the specified load conditions. For instance, the output voltage swings to within 15 mV of the negative rail with a 25 k $\Omega$  load to  $V_{DD}/2$ . Figure 2-33 shows how the output voltage is limited when the input goes beyond the linear region of operation.

The second specification that describes the output swing capability of these amplifiers is the Linear Output Voltage Swing. This specification defines the maximum output swing that can be achieved while the amplifier is still operating in its linear region. To verify linear operation in this range, the large signal (DC Open-Loop Gain ( $A_{OL}$ )) is measured at points 100 mV inside the supply rails. The measurement must exceed the specified gains in the specification table.

### 3.3 MCP603 Chip Select ( $\overline{CS}$ )

The MCP603 is a single amplifier with Chip Select ( $\overline{CS}$ ). When  $\overline{CS}$  is pulled high, the supply current drops to  $-0.7 \mu A$  (typ.), which is pulled through the  $\overline{CS}$  pin to  $V_{SS}$ . When this happens, the amplifier output is put into a high-impedance state. Pulling  $\overline{CS}$  low enables the amplifier and, if the  $\overline{CS}$  pin is left floating, the amplifier may not operate properly. Figure 1-1 is the Chip Select timing diagram and shows the output voltage, supply currents and  $\overline{CS}$  current in response to a  $\overline{CS}$  pulse. Figure 2-27 shows the measured output voltage response to a  $\overline{CS}$  pulse.

### 3.4 Capacitive Loads

Driving large capacitive loads can cause stability problems for voltage feedback op amps. As the load capacitance increases, the feedback loop's phase margin decreases and the closed-loop bandwidth is reduced. This produces gain peaking in the frequency response with overshoot and ringing in the step response.

When driving large capacitive loads with these op amps (e.g.,  $> 40$  pF when  $G = +1$ ), a small series resistor at the output ( $R_{ISO}$  in Figure 3-2) improves the feedback loop's phase margin (stability) by making the output load resistive at higher frequencies. The bandwidth will be generally lower than the bandwidth with no capacitive load.

**FIGURE 3-2:** Output resistor  $R_{ISO}$  stabilizes large capacitive loads.

Figure 3-3 gives recommended  $R_{ISO}$  values for different capacitive loads and gains. The x-axis is the normalized load capacitance ( $C_L/G_N$ ) in order to make it easier to interpret the plot for arbitrary gains.  $G_N$  is the circuit's noise gain. For non-inverting gains,  $G_N$  and the gain are equal. For inverting gains,  $G_N = 1 + |\text{Gain}|$  (e.g.,  $-1$  V/V gives  $G_N = +2$  V/V).

# MCP601/2/3/4

**FIGURE 3-3:** Recommended  $R_{ISO}$  values for capacitive loads.

Once you've selected  $R_{ISO}$  for your circuit, double-check the resulting frequency response peaking and step response overshoot in your circuit. Evaluation on the bench and simulations with the MCP601/2/3/4 SPICE macro model are very helpful. Modify  $R_{ISO}$ 's value until the response is reasonable.

## 3.5 Supply Bypass

With this family of op amps, the power supply pin ( $V_{DD}$  for single-supply) should have a local bypass capacitor (i.e., 0.01  $\mu\text{F}$  to 0.1  $\mu\text{F}$ ) within 2 mm for good high-frequency performance. It also needs a bulk capacitor (i.e., 1  $\mu\text{F}$  or larger) within 100 mm to provide large, slow currents. This bulk capacitor can be shared with other parts.

## 3.6 PCB Surface Leakage

In applications where low input bias current is critical, printed circuit board (PCB) surface leakage effects need to be considered. Surface leakage is caused by humidity, dust or other contamination on the board. Under low humidity conditions, a typical resistance between nearby traces is  $10^{12}\Omega$ . A 5V difference would cause 5 pA of current to flow. This is greater than the MCP601/2/3/4 family's bias current at +25°C (1 pA, typ.).

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins (or traces). The guard ring is biased at the same voltage as the sensitive pin. An example of this type of layout is shown in Figure 3-4.

**FIGURE 3-4:** Example Guard Ring layout.

1. Connect the guard ring to the inverting input pin ( $V_{IN-}$ ) for non-inverting gain amplifiers, including unity-gain buffers. This biases the guard ring to the common mode input voltage.
2. Connect the guard ring to the non-inverting input pin ( $V_{IN+}$ ) for inverting gain amplifiers and transimpedance amplifiers (converts current to voltage, such as photo detectors). This biases the guard ring to the same reference voltage as the op amp (e.g.,  $V_{DD}/2$  or ground).

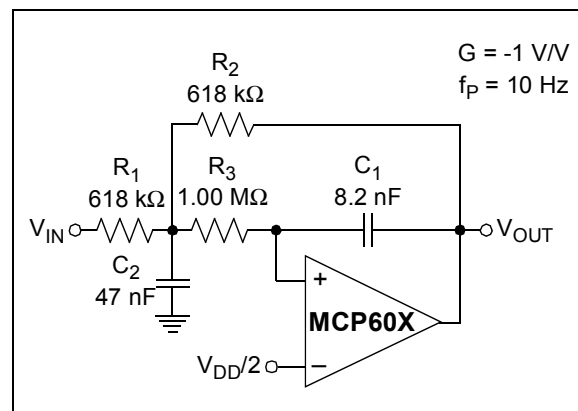

## 3.7 Typical Applications

### 3.7.1 ANALOG FILTERS

Figure 3-5 and Figure 3-6 show low-pass, second-order, Butterworth filters with a cutoff frequency of 10 Hz. The filter in Figure 3-5 has a non-inverting gain of +1 V/V, and the filter in Figure 3-6 has an inverting gain of -1 V/V.

**FIGURE 3-5:** Second-Order, Low-Pass Sallen-Key Filter.

**FIGURE 3-6:** Second-Order, Low-Pass Multiple-Feedback Filter.

The MCP601/2/3/4 family of op amps have low input bias current, which allows the designer to select larger resistor values and smaller capacitor values for these filters. This helps produce a compact PCB layout. These filters, and others, can be designed using Microchip's FilterLab<sup>®</sup> software.

## 3.7.2 INSTRUMENTATION AMPLIFIER CIRCUITS

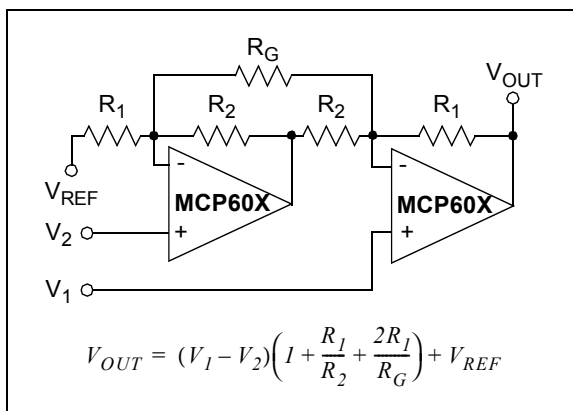

Instrumentation amplifiers have a differential input that subtracts one input voltage from another and rejects common mode signals. These amplifiers also provide a single-ended output voltage.

The three-op amp instrumentation amplifier is illustrated in Figure 3-7. One advantage of this approach is unity-gain operation, while one disadvantage is that the common mode input range is reduced as  $R_2/R_G$  gets larger.

**FIGURE 3-7:** Three-Op Amp Instrumentation Amplifier.

The two-op amp instrumentation amplifier is shown in Figure 3-8. While its power consumption is lower than the three-op amp version, its main drawbacks are that the common mode range is reduced with higher gains and it must be configured in gains of two or higher.

**FIGURE 3-8:** Two-Op Amp Instrumentation Amplifier.

Both instrumentation amplifiers should use a bulk bypass capacitor of at least 1  $\mu$ F. The CMRR of these amplifiers will be set by both the op amp CMRR and resistor matching.

## 3.7.3 PHOTO DETECTION

The MCP601/2/3/4 op amps can be used to easily convert the signal from a sensor that produces an output current (such as a photo diode) into a voltage (a transimpedance amplifier). This is implemented with a single resistor ( $R_2$ ) in the feedback loop of the amplifiers shown in Figure 3-9 and Figure 3-10. The optional capacitor ( $C_2$ ) sometimes provides stability for these circuits.

A photodiode configured in the Photovoltaic mode has zero voltage potential placed across it (Figure 3-9). In this mode, the light sensitivity and linearity is maximized, making it best suited for precision applications. The key amplifier specifications for this application are: low input bias current, low noise, common mode input voltage range (including ground) and rail-to-rail output.

**FIGURE 3-9:** Photovoltaic Mode Detector.

In contrast, a photodiode that is configured in the Photoconductive mode has a reverse bias voltage across the photo-sensing element (Figure 3-10). This decreases the diode capacitance, which facilitates high-speed operation (e.g., high-speed digital communications). The design trade-off is increased diode leakage current and linearity errors. The op amp needs to have a wide Gain Bandwidth Product (GBWP).

**FIGURE 3-10:** Photoconductive Mode Detector.

# MCP601/2/3/4

---

## 4.0 DESIGN TOOLS

Microchip provides the basic design tools needed for the MCP601/2/3/4 family of op amps.

### 4.1 SPICE Macro Model

The latest SPICE macro model of the MCP601/2/3/4 op amps is available on Microchip's web site at [www.microchip.com](http://www.microchip.com). This model is intended as an initial design tool that works well in the op amp's linear region of operation at room temperature. See the SPICE model firmware for information on its capabilities.

Bench testing is a very important part of any design and cannot be replaced with simulations. Also, simulation results using this macro model need to be validated by comparing them to the data sheet specs and plots.

### 4.2 FilterLab<sup>®</sup> 2.0

FilterLab<sup>®</sup> 2.0 is an innovative software tool that simplifies analog active-filter (using op amps) design. Available at no cost from Microchip's web site at [www.microchip.com](http://www.microchip.com), the FilterLab active-filter software design tool provides full schematic diagrams of the filter circuit with component values. It also outputs the filter circuit in SPICE format, which can be used with the macro model to simulate actual filter performance.

## 5.0 PACKAGING INFORMATION

### 5.1 Package Marking Information

5-Lead SOT-23 (MCP601 and MCP601R Only)

Example:

6-Lead SOT-23A (MCP603 Only)

Example:

<b>Legend:</b>	XX...X	Customer specific information*
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line thus limiting the number of available characters for customer specific information.	

\* Standard OTP marking consists of Microchip part number, year code, week code, and traceability code.

# MCP601/2/3/4

## Package Marking Information

8-Lead PDIP (300 mil)

Example:

8-Lead SOIC (150 mil)

Example:

8-Lead TSSOP

Example:

14-Lead PDIP (300 mil) (MCP604 Only)

Example:

14-Lead SOIC (150 mil) (MCP604 Only)

Example:

14-Lead TSSOP (4.4mm) (MCP604 Only)

Example:

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

PART NO.	X	/XX	
Device	Temperature Range	Package	
Device	MCP601	Single Op Amp	
	MCP601T	Single Op Amp (Tape and Reel for SOT23, SOIC and TSSOP)	
	MCP601RT	Single Op Amp (Tape and Reel for SOT23-5)	
	MCP602	Dual Op Amp	
	MCP602T	Dual Op Amp (Tape and Reel for SOIC and TSSOP)	
	MCP603	Single Op Amp with Chip Select	
	MCP603T	Single Op Amp with Chip Select (Tape and Reel for SOT23, SOIC and TSSOP)	
	MCP604	Quad Op Amp	
	MCP604T	Quad Op Amp (Tape and Reel for SOIC and TSSOP)	
Temperature Range	I	= -40°C to +85°C	
	E	= -40°C to +125°C	
Package	OT	= Plastic SOT23, 5-lead ( <b>MCP601 only</b> )	
	CH	= Plastic SOT23, 6-lead ( <b>MCP603 only</b> )	
	P	= Plastic DIP (300 mil Body), 8, 14-lead	
	SN	= Plastic SOIC (150 mil Body), 8-lead	
	SL	= Plastic SOIC (150 mil Body), 14-lead	
	ST	= Plastic TSSOP (4.4mm Body), 8, 14-lead	

Examples:	
a) MCP601-I/P:	Single Op Amp, Industrial Temperature, 8LD PDIP package.
b) MCP601-E/SN:	Single Op Amp, Extended Temperature, 8LD SOIC package.
c) MCP601T-I/OT:	Tape and Reel, Industrial Temperature, Single Op Amp, 5-LD SOT23 package.
d) MCP601T-E/ST:	Tape and Reel, Extended Temperature, Single Op Amp, 8LD TSSOP package
e) MCP601RT-E/OT:	Tape and Reel, Extended Temperature, Single Op Amp, Rotated, 5-LD SOT23 package.
a) MCP602-I/SN:	Dual Op Amp, Industrial Temperature, 8LD SOIC package.
b) MCP602-E/P:	Dual Op Amp, Extended Temperature, 8LD PDIP package.
c) MCP602T-E/ST:	Tape and Reel, Extended Temperature, Dual Op Amp, 8LD TSSOP package.
a) MCP603-I/SN:	Industrial Temperature, Single Op Amp with Chip Select, 8LD SOIC package.
b) MCP603-E/P:	Extended Temperature, Single Op Amp with Chip Select, 8LD PDIP package.
c) MCP603T-E/ST:	Tape and Reel, Extended Temperature, Single Op Amp with Chip Select, 8LD TSSOP package.
d) MCP603T-I/SN:	Tape and Reel, Industrial Temperature, Single Op Amp with Chip Select, 8LD SOIC package.
a) MCP604-I/P:	Industrial Temperature, Quad Op Amp, 14LD PDIP package.
b) MCP604-E/SL:	Extended Temperature, Quad Op Amp, 14LD SOIC package.
c) MCP604T-I/ST:	Tape and Reel, Industrial Temperature, Quad Op Amp, 14LD TSSOP package.

## Sales and Support

### Data Sheets

Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site ([www.microchip.com](http://www.microchip.com))

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

### New Customer Notification System

Register on our web site ([www.microchip.com/cn](http://www.microchip.com/cn)) to receive the most current information on our products.

# MCP601/2/3/4

---

NOTES:

---

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as "unbreakable."

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

**QUALITY MANAGEMENT SYSTEM  
CERTIFIED BY DNV  
== ISO/TS 16949:2002 ==**

*Microchip received ISO/TS-16949:2002 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona and Mountain View, California in October 2003. The Company's quality system processes and procedures are for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, nonvolatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001:2000 certified.*
